IBM® Netezza® Analytics
Release 11.x

Netezza Spatial Package Reference Guide

Part Number 00J2350-03 Rev. 2

Note: Before using this information and the product that it supports, read the information in "Notices and Trademarks" on page 113.

Contents

Preface

This guide describes the IBM Netezza Spatial Package.

Audience for This Guide

This guide is written for developers who intend to use the IBM Netezza Spatial Package with their IBM Netezza systems. This guide does not provide a tutorial on spatial concepts; for more informa-tion, see the *Netezza Spatial Package User's Guide*. Depending on your needs, you should be very fa-miliar with spatial analysis and the OpenGIS standards. You should also be familiar with the basic op-eration of the IBM Netezza system.

Purpose of This Guide

This guide describes the IBM Netezza Spatial Package. The Package provides spatial analysis functions that can be used on the IBM Netezza database warehouse appliance.

Conventions

Note on Terminology: The terms User-Defined Analytic Process (UDAP) and Analytic Executable (AE) are synonymous.

The following conventions apply:

- *Italics* for emphasis on terms and user-defined values, such as user input.
- Upper case for SQL commands, for example, INSERT or DELETE.
- Bold for command line input, for example, **nzsystem stop**.
- Bold to denote parameter names, argument names, or other named references.
- Angle brackets (< >) to indicate a placeholder (variable) that should be replaced with actual text, for example, **nzmat <- nz.matrix("<matrix_name>")**.
- A single backslash ("\") at the end of a line of code to denote a line continuation. Omit the back-slash when using the code at the command line, in a SQL command, or in a file.
- When referencing a sequence of menu and submenu selections, the ">" character denotes the different menu options, for example *Menu Name > Submenu Name > Selection*.

If You Need Help

If you are having trouble using the IBM Netezza appliance, IBM Netezza Analytics or any of its com-ponents:

1. Retry the action, carefully following the instructions in the documentation.
2. Go to the IBM Support Portal at http://www.ibm.com/support. Log in using your IBM ID and password. You can search the Support Portal for solutions. To submit a support re-quest, click the 'Service Requests & PMRs' tab.
3. If you have an active service contract maintenance agreement with IBM, you can contact customer support teams via telephone. For individual countries, please visit the Technical

Support section of the IBM Directory of worldwide contacts:
http://www14.software.ibm.com/webapp/set2/sas/f/handbook/contacts.html#phone.

Comments on the Documentation

We welcome any questions, comments, or suggestions that you have for the IBM Netezza document-ation. Please send us an e-mail message at netezza-doc@wwpdl.vnet.ibm.com and include the fol-lowing information:

- The name and version of the manual that you are using
- Any comments that you have about the manual
- Your name, address, and phone number

We appreciate your comments.

CHAPTER 1
List of functions by category

Spatial

ST_Area - Area of the Geometry

ST_AsBinary - Well-known Binary Representation of the

Geometry ST_AsKML - KML representation of a Geometry

ST_AsText - WKT representation of a Geometry

ST_Boundary - Boundary of the Geometry

ST_Buffer - Buffer around the Geometry

ST_Centroid - Centroid of the Geometry

ST_Collect - Collect multiple point geometries and generate a multipoint geometry from it

ST_Collect - Collect multiple point geometries from a table and generate a table of multipoint geo-metries from it

ST_Contains - Checks Containment of Two Geometries

ST_ConvexHull - Convex Hull of a Geometry

ST_CoordDim - Coordinate Dimension

ST_Crosses - Checks if Geometries Cross

ST_Difference - Difference of Two Geometries

ST_Dimension - Dimension of the geometry

ST_Disjoint - Checks if Geometries are Disjoint

ST_Distance - Distance between Geometries

ST_DWithin - Distance Within

ST_Ellipse - Ellipse Constructor

ST_EndPoint - End Point of a Line

ST_Envelope - Bounding Box of a Geometry

ST_Equals - Checks if Geometries are Equal

ST_Expand - Expanded Bounding Rectangle of a Geometry

ST_ExteriorRing - Exterior Ring of a Polygon

ST_GeometryN - Nth Geometry from a Geometry Collection

ST_GeometryType - Type of a Geometry

ST_GeometryTypeID - Geometry Type of a Geometry

ST_GeomFromText - Geometry from WKT Representation

ST_GeomFromWKB - Geometry from WKB Representation

ST_GrandMBR - Bounding Box from a Set of Geometries

ST_InteriorRingN - Nth Interior Ring from the Polygon

ST_Intersection - Create a geometry that is the union of a table of geometries.

ST_Intersection - Intersection of Geometries

ST_Intersects - Checks if Geometries Intersect

ST_Intersects - Create a geometry that is the union of a table of geometries.

ST_Is3D - Checks if Geometry has Z Coordinate

ST_IsClosed - Checks if the Line is Closed

ST_IsEmpty - Checks if the Geometry is Empty

ST_IsMeasured - Checks if the Geometry has an M

Coordinate ST_IsRing - Checks if the Line is a Ring

ST_IsSimple - Checks if the Geometry is Simple

ST_Length - Length of the Line

ST_LineFromMultiPoint - Make a Linstring from a Multipoint

geometry ST_LocateAlong - Locate Along

ST_LocateBetween - Locate Between

ST_M - M Coordinate of a Point

ST_MaxM - Maximum M Coordinate of a Geometry

ST_MaxX - Maximum X Coordinate of a Geometry

ST_MaxY - Maximum Y Coordinate of a Geometry

ST_MaxZ - Maximum Z Coordinate of a Geometry

ST_MBR - Bounding Box of a Geometry

ST_MBRIntersects - Checks if MBRs of the Geometries

Intersect ST_MinM - Minimum M Coordinate of a Geometry

ST_MinX - Minimum X Coordinate of a Geometry

ST_MinY - Minimum Y Coordinate of a Geometry

ST_MinZ - Minimum Z Coordinate of a Geometry

ST_NumGeometries - Number of Geometries in a Collection

ST_NumInteriorRing - Number of Interior Rings

ST_NumPoints - Number of Vertices of the Geometry

ST_Overlaps - Checks if Geometries Overlap

ST_Perimeter - Perimeter of Geometry

ST_Point - Point Constructor

ST_PointN - Nth Point in Linestring

ST_PointOnSurface - Point on the Surface

ST_Relate - Relation of Geometries

ST_SRID - Setter/Getter of the SRID

ST_StartPoint - First Point of a Line

ST_SymDifference - Symmetric Difference of Geometries

ST_Touches - Checks if Geometries Touch

ST_Union - Create a geometry that is the union of a table of geometries.

ST_Union - Union of Geometries

ST_Version - IBM Netezza Spatial Version

ST_Within - Checks if the Geometry is Within Another Geometry

ST_WKBToSQL - Geometry from WKB Representation

ST_WKBToWKT - WKT Representation from WKB Format

ST_WKTToSQL - Geometry from WKT Representation

ST_WKTToWKB - WKB Representation from WKT Format

ST_X - X Coordinate of a Point

ST_Y - Y Coordinate of a Point

ST_Z - Z Coordinate of a Point

Utilities - Actions

ST_CreateGeomColumn - Create the Geometry Column Table

ST_CreateSpatialRefSys - Create the Spatial Reference System Table

ST_MapPolygonsToGrid - Maps polygons to a grid

ST_SpatialGridIndex - Creates a spatial grid index

CHAPTER 2
Reference Documentation: Spatial

ST_Area - Area of the Geometry

Determines the area of the specified geometry object having a surface.

Usage

The ST_Area function has the following syntax:

- **ST_Area(VARCHAR(ANY) ST_Geometry, VARCHAR(ANY) unit, VARCHAR(ANY) cSystem);**
  - Parameters
    - **ST_Geometry**
      The geometry object.

      Type: VARCHAR(ANY)
    - **unit**
      The units. Possible values include "meter", "kilometer", "foot", "mile" and "nautical mile".

      Type: VARCHAR(ANY)

      Default: 'meter'
    - **cSystem**
      The coordinate system.

      Type: VARCHAR(ANY)

      Default: From geometry's SRID or 'WGS84' if geometry has no SRID.
  - Returns
    DOUBLE The area of the specified geometry object.

Details

This function returns the area of the specified geometry object (in WKB format) having a surface:

polygon, multipolygon, geometry collection. SRID and units are supported. In the cartesian case, this function returns an accurate value. In the spherical case, the area is calculated by dividing the geometry into spherical triangles and calculating their areas using spherical excess / Huiller's formula. It deals with geometries that cross the 180 meridian or contain the pole. In the spheroidal case, the geometry is projected into a cartesian coordinate system by Behrmann Equal Area projection and its area is calculated in the same way as the cartesian case.

Examples

```
SELECT inza..ST_Area(inza..ST_WKTToSQL('POLYGON((1 1,
1 2, 2 2, 2 1, 1 1))', 1234));
 ST_AREA
---------
       1
(1 row)

SELECT inza..ST_Area(inza..ST_WKTToSQL('POLYGON((1 1,
1 2, 2 2, 2 1, 1 1))', 1111));
     ST_AREA
-----------------
 12367196844.731
(1 row)

SELECT inza..ST_Area(inza..ST_WKTToSQL('POLYGON((1 1,
1 2, 2 2, 2 1, 1 1))', 4326));
     ST_AREA
-----------------
 12304814950.073
(1 row)

SELECT inza..ST_Area(inza..ST_WKTToSQL('POLYGON((1 1,
1 2, 2 2, 2 1, 1 1))', 1234), 'foot');
    ST_AREA
----------------
 10.76391041671
(1 row)
```

```
SELECT inza..ST_Area(inza..ST_WKTToSQL('POLYGON((1 1, 1 2, 2 2,
2 1, 1 1))', 1234), 'meter', 'sphere');
     ST_AREA
-----------------
 12367196844.731
(1 row)

SELECT inza..ST_Area(inza..ST_WKTToSQL('POLYGON((1 1, 1 2, 2 2,
2 1, 1 1))'), 'meter', 1111);
     ST_AREA
-----------------
 12367196844.731
(1 row)
```

Related Functions

- category Spatial

ST_AsBinary - Well-known Binary Representation of the Geometry

Determines the Well-Known Binary (WKB) representation of a geometry object without the SRID.

Usage

The ST_AsBinary function has the following syntax:

- **ST_AsBinary(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      The geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) The Well-Known Binary (WKB) representation of a geometry object without the SRID.

Details

Takes a geometry object and returns its well-known binary representation. ST_AsBinary is the reverse of ST_WKBToSQL.

Examples

```
SELECT
inza..ST_AsText(inza..ST_WKBToSQL(inza..ST_AsBinary(inza.
.ST_Point(1, 2))));

ST_ASTEXT

-----------

 POINT (1 2)

(1 row)
```

Related Functions

- category Spatial
- ST_AsText
- ST_GeomFromText
- ST_GeomFromWKB
- ST_WKBToSQL
- ST_WKTToSQL

ST_AsKML - KML representation of a Geometry

Returns the Keyhole Markup Language (KML) representation of a geometry object.

Usage

The ST_AsKML function has the following syntax:

- **ST_AsKML(VARCHAR(ANY) ST_Geometry); VARCHAR(ANY) = ST_AsKML(VARCHAR(ANY) ST_Geometry, VARCHAR(ANY) additionalKMLAttributes);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
    - **additionalKMLAttributes**
      (Optional) Select one of <extrude>, <tessellate> or

      <altitudeMode>. Type: VARCHAR(ANY)

      Default: ''
  - Returns
    VARCHAR(ANY) The Keyhole Markup Language (KML) representation of a geometry object.

Details

The "additionalKMLAttributes" are not validated and are simply added to the output.

Examples

```
SELECT inza..ST_AsKML(inza..ST_Point(1, 5));

 ST_ASKML

 ----------

 <Point><coordinates>1,5</coordinates></Point>

(1 row)

SELECT inza..ST_AsKML(inza..ST_Point(1, 5),

'<extrude>1</extrude><altitudeMode>clampToGround</altitudeMode>' );

ST_ASKML

----------

 <Point><extrude>1</extrude><altitudeMode>clampToGround</altitu
deMode><coordinates>1,5</coordinates></Point

> (1 row)
```

Related Functions

- category Spatial

ST_AsText - WKT representation of a Geometry

Returns the Well-Known Text (WKT) representation of a geometry object.

Usage

The ST_AsText function has the following syntax:

- **ST_AsText(VARCHAR(ANY) Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) The Well-Known Text (WKT) representation of a geometry object.

Details

Does not return the SRID. ST_AsText is the reverse of ST_GeomFromText.

Examples

```
select inza..ST_AsText(inza..ST_Point(1.0,
5.0)); ST_ASTEXT
------------
 POINT (1 5)
(1 row)

select inza..ST_AsText(inza..ST_WKTToSQL('POLYGON((10
10, 10 20, 20 20, 20 15, 10 10))'));
ST_ASTEXT
------------
 POLYGON ((10 10, 10 20, 20 20, 20 15, 10 10))
(1 row)
```

Related Functions

- category Spatial
- ST_GeomFromText
- ST_GeomFromWKB
- ST_WKTToSQL
- ST_WKBToSQL
- ST_AsBinary

ST_Boundary - Boundary of the Geometry

Determines the boundary of a geometry object.

Usage

The ST_Boundary function has the following syntax:

- **ST_Boundary(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)

- Returns
  VARCHAR(ANY) A geometry object.

Details

ST_Boundary takes a geometry object and returns its combined boundary as a geometry object.

Examples

```
SELECT
inza..ST_AsText(inza..ST_Boundary(inza..ST_WKTToSQL('POLYGON ((1
1, 1 2, 2 2, 2 1, 1 1))')));
ST_ASTEXT
-----------
 LINESTRING (1 1, 1 2, 2 2, 2 1, 1 1)
(1 row)

SELECT
inza..ST_AsText(inza..ST_Boundary(inza..ST_WKTToSQL('LINESTRING
(0 0, 1 1, 2 2)')));
ST_ASTEXT
-----------
 MULTIPOINT (0 0, 2 2)
(1 row)
```

Related Functions

- category Spatial

ST_Buffer - Buffer around the Geometry

Determines a buffer region around the specified geometry having the width specified by the distance para-meter and a number of segments used to approximate a quarter of a circle.

Usage

The ST_Buffer function has the following syntax:

- **ST_Buffer(VARCHAR(ANY) ST_Geometry, DOUBLE distance, INT nSegments, VARCHAR(ANY) unit, VARCHAR(ANY) cSystem);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

Type: VARCHAR(ANY)

- **distance**
  The buffer distance.

  Type: DOUBLE

- **nSegments**
  The number of segments used to approximate a quarter of a

  circle. Type: INT

  Default: 8

- **unit**
  The units. Possible values include "meter", "kilometer", "foot", "mile" and "nautical mile".

  Type: VARCHAR(ANY)

  Default: 'meter'

- **cSystem**
  The coordinate system.

  Type: VARCHAR(ANY)

  Default: From geometry's SRID or 'WGS84' if geometry has no SRID.

▲ Returns
VARCHAR(64000) A geometry object that is a buffer region around the specified geometry.

Details

This function supports only points using the spherical and WGS84 coordinate systems.

Examples

```
SELECT inza..ST_AsText(inza..ST_Buffer(inza..ST_Point(0,
0, 1234), 1, 2));
ST_ASTEXT
-----------
 POLYGON ((1 0, 0.707106781186548 -0.707106781186547,

Related Functions

- category Spatial

ST_Centroid - Centroid of the Geometry

Determines the geometric center of a geometry object.

Usage

The ST_Centroid function has the following syntax:

- **ST_Centroid(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(100) A point geometry object.

Details

The geometric center of the geometry is the "average" of the points in the geometry. The result is not guar-

anteed to be on the geometry. If the geometry is empty, then an empty point is returned.

Examples

```
SELECT
inza..ST_AsText(inza..ST_Centroid(inza..ST_WKTToSQL('LINE
STRING (0 0, 10 0)')));
ST_ASTEXT
-----------
 POINT (5 0)
(1 row)

SELECT
inza..ST_AsText(inza..ST_Centroid(inza..ST_WKTToSQL('POLY
GON ((10 10, 10 20, 20 20, 20 15, 10 10))')));
ST_ASTEXT
-----------
 POINT (14.4444444444444 16.1111111111111)
(1 row)
```

Related Functions

- category Spatial

ST_Collect - Collect multiple point geometries and generate a multipoint geometry from it

Creates a multipoint geometry from a table of points

Usage

The ST_Collect aggregate has the following syntax:

- **ST_Collect(VARCHAR(ANY) geometry);**
  - Parameters
    - **geometry**
      A point geometry object.

      Type: VARCHAR(ANY)
  - Returns

VARCHAR(ANY) The multipoint geometry object.

Examples

```
CREATE TABLE points (PointID integer, the_geom varchar(200));
INSERT INTO points VALUES (1, inza..ST_WKTToSQL('Point (0 0)'));
INSERT INTO points VALUES (2, inza..ST_WKTToSQL('Point (22
0)'));
INSERT INTO points VALUES (3, inza..ST_WKTToSQL('Point (33
33)'));
INSERT INTO points VALUES (4, inza..ST_WKTToSQL('Point (44
44)'));
SELECT inza..ST_AsText(inza..ST_Collect(the_geom)) from (SELECT
the_geom from points order by PointID LIMIT 9999999) points;
DROP TABLE points;
                ST_ASTEXT
----------------------------------------
 MULTIPOINT (0 0, 22 0, 33 33, 44 44)
(1 row)
```

Related Functions

- category Spatial

ST_Collect - Collect multiple point geometries from a table and generate a table of multipoint geometries from it

Creates a table of multipoint geometries from a table of points

Usage

The ST_Collect table function has the following syntax:

- **ST_Collect(VARCHAR(ANY) Varchar);**
  - Parameters
    - **VARCHAR**
      A point geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) The multipoint geometry object named "multipoint".

Examples

```
CREATE TABLE trip_points (trip_id integer,
geom varchar(200), timestamp integer);
INSERT INTO trip_points VALUES (100,
inza..ST_WKTToSQL('Point (100 100)'), 120212);
INSERT INTO trip_points VALUES (100,
inza..ST_WKTToSQL('Point (200 200)'), 120312);
INSERT INTO trip_points VALUES (100,
inza..ST_WKTToSQL('Point (300 300)'), 120412);
INSERT INTO trip_points VALUES (100,
inza..ST_WKTToSQL('Point (400 400)'), 120512);
INSERT INTO trip_points VALUES (200,
inza..ST_WKTToSQL('Point (200 200)'), 120212);
INSERT INTO trip_points VALUES (200,
inza..ST_WKTToSQL('Point (300 300)'), 120312);
INSERT INTO trip_points VALUES (200,
inza..ST_WKTToSQL('Point (100 100)'), 120412);
INSERT INTO trip_points VALUES (200,
inza..ST_WKTToSQL('Point (400 400)'), 120512);
INSERT INTO trip_points VALUES (300,
inza..ST_WKTToSQL('Point (400 400)'), 120212);
INSERT INTO trip_points VALUES (300,
inza..ST_WKTToSQL('Point (300 300)'), 120312);
INSERT INTO trip_points VALUES (300,
inza..ST_WKTToSQL('Point (200 200)'), 120412);
INSERT INTO trip_points VALUES (300,
inza..ST_WKTToSQL('Point (100 100)'), 120512);
select trip_id, inza..st_astext(tf.multipoint) from
(select inza..st_astext(geom), geom, trip_id, lag(0,1,1)
over (partition by trip_id order by timestamp) as

ST_Contains - Checks Containment of Two Geometries

Determines whether the first specified geometry contains the second geometry.

Usage

The ST_Contains function has the following syntax:

- **ST_Contains(VARCHAR(ANY) ST_Geometry1, ARCHAR(ANY) ST_Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    BOOL TRUE if the first geometry contains the second geometry; otherwise FALSE.

Details

ST_Contains is the reverse of ST_Within. The current implementation performs calculations treating all co-ordinate systems as cartesian.

Examples

```
SELECT inza..ST_Contains(inza..ST_WKTToSQL('POLYGON ((0 0, 11 0,
11 11, 0 11, 0 0))'), inza..ST_WKTToSQL('POLYGON ((10 10, 10 20,
20 20, 20 15, 10 10))'));
ST_CONTAINS
-------------
 f
(1 row)
```

```
SELECT inza..ST_Contains(inza..ST_WKTToSQL('POLYGON ((0
0, 110 0, 110 110, 0 110, 0 0))'),
inza..ST_WKTToSQL('POLYGON ((10 10, 10 20, 20 20, 20 15,
10 10))'));

ST_CONTAINS
-------------
 t
(1 row)
```

ST_ConvexHull - Convex Hull of a Geometry

Determines the smallest convex geometry that contains all of the points of the specified geometry object.

Usage

The ST_ConvexHull function has the following syntax:

- **ST_ConvexHull(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) A geometry object.

Examples

```
SELECT
inza..ST_AsText(inza..ST_ConvexHull(inza..ST_WKTToSQL('PO
INT (0 0)')));

ST_CoordDim - Coordinate Dimension

Determines the coordinate dimension the geometry object.

Usage

The ST_CoordDim function has the following syntax:

- **ST_CoordDim(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    INT If the geometry only has x and y coordinates, then 2 is returned. If the geometry additionally has z or m, then 3 is returned. If the geometry has x, y, z and m coordinates, then 4 is returned. If the geometry is empty, 2 is returned.

Examples

```
SELECT inza..ST_CoordDim(inza..ST_WKTToSQL('POINT (0 0)'));
```

```
ST_COORDDIM

ST_Crosses - Checks if Geometries Cross

Determines if the first specified geometry crosses the second geometry.

Usage

The ST_Crosses function has the following syntax:

- **ST_Crosses(VARCHAR(ANY) ST_Geometry1, VARCHAR(ANY) ST_Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    BOOL Returns TRUE if the first geometry crosses the second geometry; otherwise FALSE.

Details

Returns TRUE if the DE-9IM intersection matrix for the two geometries is T*T****** or, for two lines, 0********. The current implementation performs calculations treating all coordinate sys-tems as cartesian.

Examples

```
SELECT inza..ST_Crosses(inza..ST_WKTToSQL('LINESTRING (0 0,
10 10)'), inza..ST_WKTToSQL('LINESTRING (0 5, 10 5)'));

ST_Difference - Difference of Two Geometries

Detemines which points in the first specified geometry are not in the second geometry.

Usage

The ST_Difference function has the following syntax:

- **ST_Difference(VARCHAR(ANY) ST_Geometry1, VARCHAR(ANY) ST_Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) Returns a geometry object representing the points in the first geometry that are not in the second geometry.

Examples

```
SELECT
inza..ST_AsText(inza..ST_Difference(inza..ST_WKTToSQL('POLYGON
((0 0, 11 0, 11 11, 0 11, 0 0))'), inza..ST_WKTToSQL('POLYGON

ST_Dimension - Dimension of the geometry

Determines the dimension of a geometry object. Note that the returned dimension is not the co-ordinate dimension.

Usage

The ST_Dimension function has the following syntax:

- **ST_Dimension(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    INT Returns 0 for point, 1 for lines, 2 for polygons, or the highest dimension of the con-tents of a geometry collection; returns -1 for an empty geometry collection.

Examples

```
SELECT inza..ST_Dimension(inza..ST_WKTToSQL('POINT
(0 0)'));
 ST_DIMENSION
--------------
            0
(1 row)

SELECT inza..ST_Dimension(inza..ST_WKTToSQL('LINESTRING

ST_Disjoint - Checks if Geometries are Disjoint

Determines if the two specified geometries do not intersect.

Usage

The ST_Disjoint function has the following syntax:

- **ST_Disjoint(VARCHAR(ANY) ST_Geometry1, VARCHAR(ANY) ST_Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    BOOL TRUE if the two geometries do not intersect; otherwise FALSE.

Details

Returns TRUE if the DE-9IM intersection matrix for the two geometries is FF*FF****. The current imple-mentation performs calculations treating all coordinate systems as cartesian.

Examples

```
SELECT inza..ST_Disjoint(inza..ST_WKTToSQL('LINESTRING (0 0, 10
10)'), inza..ST_WKTToSQL('LINESTRING (0 5, 10 5)'));

ST_Distance - Distance between Geometries

Determines the minimum distance between two points or segments.

Usage

The ST_Distance function has the following syntax:

- **ST_Distance(VARCHAR(ANY) ST_Geometry1, VARCHAR(ANY) ST_Geometry2, VARCHAR(ANY) unit, VARCHAR(ANY) cSystem, BOOL intersectTest);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
    - **unit**
      The units. Possible values include "meter", "kilometer", "foot", "mile" and "nautical mile".

      Type: VARCHAR(ANY)

      Default: 'meter'
    - **cSystem**
      The coordinate system.

      Type: VARCHAR(ANY)

      Default: From geometry's SRID or 'WGS84' if geometry has no SRID.
    - **intersectTest**
      (Optional) If enabled, tests for intersection between the geometries and returns 0 if they do. Otherise, calculate distance between the geometries.

      Type: BOOL

      Default: TRUE

- Returns
  DOUBLE Returns distance as the minimum distance between two points or segments describing the two ST_Geometry values.

Details

This function returns the minimum distance from any points or segments describing one geometry, ST_Geo-metry1, to any points or segments describing a second geometry, ST_Geometry2. SRID support.

Examples

```
SELECT inza..ST_Distance(inza..ST_Point(0, 0,
1234), inza..ST_Point(1, 0, 1234));
 ST_DISTANCE
-------------

ST_DWithin - Distance Within

Determines whether two geometries are within the specified distance of one another.

Usage

The ST_DWithin function has the following syntax:

- **ST_DWithin(VARCHAR(ANY) ST_Geometry1, VARCHAR(ANY) ST_Geometry2, DOUBLE dis-tance, VARCHAR(ANY) unit, VARCHAR(ANY) cSystem);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
    - **distance**
      The distance within which the geometries must

      be. Type: DOUBLE
    - **unit**
      The units. Possible values include "meter", "kilometer", "foot", "mile" and "nautical mile".

      Type: VARCHAR(ANY)

      Default: 'meter'
    - **cSystem**
      The coordinate system.

      Type: VARCHAR(ANY)

      Default: From geometry's SRID or 'WGS84' if geometry has no SRID.
  - Returns
    BOOL Returns TRUE if the geometries are within the specified distance of one another; otherwise FALSE.

Examples

```
SELECT inza..ST_DWithin(inza..ST_Point(0,0),
inza..ST_Point(1,1), 2, 'meter', 'cartesian');

ST_Ellipse - Ellipse Constructor

Specifies an ellipse with the specified center, axes, and tilt.

Usage

The ST_Ellipse function has the following syntax:

- **ST_Ellipse(DOUBLE x0, DOUBLE y0, DOUBLE a, DOUBLE b, DOUBLE tilt, INT nSegment, VARCHAR(ANY) unit, VARCHAR(ANY) cSystems); VARCHAR(64000) = ST_Ellipse(VARCHAR(ANY) ST_Geometry, DOUBLE a, DOUBLE b, DOUBLE tilt, INT nSegments, VARCHAR(ANY) unit, VARCHAR(ANY) cSystem);**
  - Parameters
    - **x0**
      The longtitude or the x-coordinate of the
      center. Type: DOUBLE
    - **y0**
      The latitude or the y-coordinate of the
      center. Type: DOUBLE
    - **ST_Geometry**
      A geometry object.
      Type: VARCHAR(ANY)
    - **a**

The semi-major axis.

Type: DOUBLE

- **b**
  The semi-minor

  axis. Type: DOUBLE

- **tilt**
  The major axis tilt.

  Type: DOUBLE

- **nSegments**
  The number of segments used to approximate a quarter of a

  circle. Type: INT

  Default: 8

- **unit**
  The units. Possible values include "meter", "kilometer", "foot", "mile" and "nautical mile".

  Type: VARCHAR(ANY)

  Default: 'meter'

- **cSystem**
  The coordinate system.

  Type: VARCHAR(ANY)

  Default: 'WGS84'

- Returns
  VARCHAR(64000) Returns an ellipse (polygon) with the specified center, axes, and tilt.

Examples

```
SELECT inza..ST_AsText(inza..ST_Ellipse(1.0, 2.0,
100.0, 50.0, 30.0, 2, 'meter', 'cartesian'));

ST_Envelope - Bounding Box of a Geometry

Determines the bounding box of a geometry object.

Usage

The ST_Envelope function has the following syntax:

- **ST_Envelope(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(200) The bounding box, or envelope, as a geometry object.

Details

This function always returns a rectangle as a polygon. ST_Envelope is exactly the same as ST_MBR.

Examples

```
SELECT
inza..ST_AsText(inza..ST_Envelope(inza..ST_WKTToSQL('LINE
STRING (0 0, 1 -1, 2 2)')));
ST_ASTEXT
-----------

ST_Equals - Checks if Geometries are Equal

Determines is two geometries are equal.

Usage

The ST_Equals function has the following syntax:

- **ST_Equals(VARCHAR(ANY) ST_Geometry1, VARCHAR(ANY) ST_Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    BOOL TRUE if the two geometries are equal; otherwise FALSE.

Details

Returns TRUE if the DE-9IM intersection matrix for the two geometries is T*F**FFF*.

Examples

```
SELECT inza..ST_Equals(inza..ST_WKTToSQL('LINESTRING (0 0, 10
10)'), inza..ST_WKTToSQL('LINESTRING (0 0, 10 10)'));

ST_Expand - Expanded Bounding Rectangle of a Geometry

Determines the minimum bounding rectangle of a geometry object expanded by the distance parameter.

Usage

The ST_Expand function has the following syntax:

- **ST_Expand(VARCHAR(ANY) ST_Geometry, DOUBLE distance, VARCHAR(ANY) unit, VARCHAR(ANY) cSystem);**
  - Parameters
    - **ST_Geometry**

A geometry object.

Type: VARCHAR(ANY)

- **distance**
  The distance to expand the bounding box around the input geometry's

  MBR. Type: DOUBLE

- **unit**
  The units. Possible values include "meter", "kilometer", "foot", "mile" and "nautical mile".

  Type: VARCHAR(ANY)

  Default: 'meter'

- **cSystem**
  The coordinate system.

  Type: VARCHAR(ANY)

  Default: From geometry's SRID or 'WGS84' if the geometry has no SRID.

▲ Returns
VARCHAR(200) A polygon that is the new MBR of the input geometry's MBR, expanded by the specified distance value.

Examples

```
SELECT
inza..ST_AsText(inza..ST_Expand(inza..ST_WKTToSQL('POLYGO N
((10 10, 10 20, 20 20, 20 15, 10 10))', 1234), 100));

ST_GeomFromText - Geometry from WKT Representation

Determines a geometry object from the Well-Known Text (WKT) representation.

Usage

The ST_GeomFromText function has the following syntax:

- **ST_GeomFromText(VARCHAR(ANY) WKTString); VARCHAR(ANY) =**

ST_GeomFromText(VARCHAR(ANY) WKTSTring,INT4 Srid); VARCHAR(ANY) = ST_GeomFromText(VARCHAR(ANY),INT4 Srid, BOOL ComputeMBR);

- Parameters
  - **ST_Geometry**
    A geometry object.

    Type: VARCHAR(ANY)
  - **SRID**
    The Spatial Reference System

    Identifier. Type: INT4

    Default: 4326
  - **computeMBRFlag**
    (Optional) Indicates whether the MBR should be

    computed. Type: BOOL

    Default: TRUE
- Returns
  VARCHAR(ANY) A geometry object.

Details

ST_GeomFromWKT is exactly the same as ST_WKTToSQL. ST_WKTToSQL is the reverse of ST_AsText.

Examples

```
SELECT inza..ST_GeomFromText('POLYGON ((10 10, 10 20, 20 20, 20
15, 10 10))');

      Indicates whether the MBR should be

      computed. Type: BOOL

      Default: TRUE
  - Returns
    VARCHAR(ANY) A geometry object.

Details

ST_GeomFromWKB is exactly the same as ST_WKBToSQL. ST_WKBToSQL is the reverse of ST_AsBinary.

Examples

```
select
inza..ST_AsText(inza..ST_GeomFromWKB(inza..ST_AsBinary(inza..ST_
WKTToSQL('POLYGON ((0 0, 11 0, 11 11, 0 11, 0 0))'))));

ST_ASTEXT
-------------------------------------------------------------------
-------------------------------------------------------------------
-------------------------------------------------------------------
----------------------
 POLYGON ((0 0, 11 0, 11 11, 0 11, 0 0))
(1 row)

select
inza..ST_AsText(inza..ST_GeomFromWKB(inza..ST_AsBinary(inza..ST_
WKTToSQL('LINESTRING(0 0, 3 4, -1 1)'))));
                                                                ST
_ASTEXT
-------------------------------------------------------------------
-------------------------------------------------------------------
-----
 LINESTRING (0 0, 3 4, -1 1)
(1 row)

select
inza..ST_AsText(inza..ST_GeomFromWKB(inza..ST_AsBinary(inza..ST_
Point(1, 5))));
ST_ASTEXT
-----------
 POINT (1 5)
(1 row)
```

ST_GrandMBR - Bounding Box from a Set of Geometries

Determines the bounding box from a set of geometry objects.

Usage

The ST_GrandMBR function has the following syntax:

- **ST_GrandMBR(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(200) The bounding box as a geometry object.

Examples

```
CREATE TABLE polygons (PointID integer,
the_geom varchar(200));
INSERT INTO polygons VALUES (1,
inza..ST_WKTToSQL('Polygon ((0 0, 11 0, 11 11, 0 11,
0 0))'));
INSERT INTO polygons VALUES (2,
inza..ST_WKTToSQL('Polygon ((0 0, 22 0, 22 22, 0 22,
0 0))'));
INSERT INTO polygons VALUES (3,
inza..ST_WKTToSQL('Polygon ((0 0, 33 0, 33 33, 0 33,
0 0))'));
INSERT INTO polygons VALUES (4,
inza..ST_WKTToSQL('Polygon ((0 0, 44 0, 44 44, 0 44,
0 0))'));
SELECT inza..ST_AsText(inza..ST_GrandMBR(the_geom))
from polygons;
DROP TABLE polygons;

ST_ASTEXT
-------------------------------------------------------
```

```
-------------------------------------------------------------
-------------------------------------------------------------
----------------------------

 POLYGON  ((0 0, 0 44, 44 44, 44 0, 0 0))

(1 row)
```

ST_InteriorRingN - Nth Interior Ring from the Polygon

Determines the Nth interior ring from the specified polygon object.

Usage

The ST_InteriorRingN function has the following syntax:

- **ST_InteriorRingN(VARCHAR(ANY) Geometry, INT4 N);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
    - **N**
      A 1-based index.

      Type: INT4
  - Returns
    VARCHAR(ANY) A line geometry object; NULL if the Nth interior ring is not found.

Examples

```
SELECT
inza..ST_AsText(inza..ST_InteriorRingN(inza..ST_WKTToSQL('POLYGO
N ((0 0, 100 0, 100 100, 0 100, 0 0), (10 10, 10 20, 20 20, 20
15, 10 10))'), 1));
ST_ASTEXT
-----------
 LINESTRING (10 10, 10 20, 20 20, 20 15, 10 10)
(1 row)

SELECT inza..ST_InteriorRingN(inza..ST_WKTToSQL('Polygon ((10
10, 10 20, 20 20, 20 15, 10 10))'), 5);
```

```

ST_Intersection - Create a geometry that is the union of a table of geo-metries.

Creates a geometry by doing a union on a table of geometries

Usage

The ST_Intersection aggregate has the following syntax:

- **ST_Intersection(VARCHAR(ANY) geometry);**
  - Parameters
    - **geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) The unified geometry object.

Examples

```
CREATE TABLE points (PointID integer,
the_geom VARCHAR(200));
INSERT INTO points VALUES (1, inza..ST_WKTToSQL('Point
(0 0)'));
INSERT INTO points VALUES (2,
inza..ST_WKTToSQL('Point (22 0)'));
INSERT INTO points VALUES (3,
inza..ST_WKTToSQL('Point (33 33)'));
INSERT INTO points VALUES (4,
inza..ST_WKTToSQL('Point (44 44)'));
SELECT  inza..ST_AsText(inza..ST_Intersection(the_geom))
from  (SELECT  the_geom  from  points  order  by  PointID
LIMIT 9999999) points;
```

```

ST_Intersection - Intersection of Geometries

Determines a geometry object representing the points shared by the specified geometries.

Usage

The ST_Intersection function has the following syntax:

- **ST_Intersection(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) The shared geometry object. The geometry object may be empty if no points are shared.

Details

The current implementation performs calculations treating all coordinate systems as cartesian.

Examples

```
SELECT
inza..ST_AsText(inza..ST_Intersection(inza..ST_WKTToSQL('POLYGON
((0 0, 11 0, 11 11, 0 11, 0 0))'), inza..ST_WKTToSQL('POLYGON

ST_Intersects - Checks if Geometries Intersect

Determines whether two geometries intersect.

Usage

The ST_Intersects function has the following syntax:

- **ST_Intersects(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

Type: VARCHAR(ANY)

- **ST_Geometry2**
  A geometry object.

  Type: VARCHAR(ANY)

- Returns
  BOOL Returns TRUE if the two geometries intersect; otherwise FALSE.

Details

Returns TRUE if the DE-9IM intersection matrix for the two geometries is not FF*FF****. The current imple-mentation performs calculations treating all coordinate systems as cartesian.

Examples

```
SELECT inza..ST_Intersects(inza..ST_WKTToSQL('POLYGON ((0 0, 11
0, 11 11, 0 11, 0 0))'), inza..ST_WKTToSQL('POLYGON ((10 10, 10

ST_IsClosed - Checks if the Line is Closed

Determines if a line is closed.

Usage

The ST_IsClosed function has the following syntax:

- **ST_IsClosed(VARCHAR(ANY) Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object, which must be a

      line. Type: VARCHAR(ANY)
  - Returns
    BOOL Returns TRUE if the line is closed; otherwise FALSE.

Details

A line is closed if the start and end points are equal.

Examples

```
SELECT inza..ST_IsClosed(inza..ST_WKTToSQL('LINESTRING
(0 0, 11 0, 11 11, 0 0)'));

ST_IsRing - Checks if the Line is a Ring

Determines whether a line is a ring.

Usage

The ST_IsRing function has the following syntax:

- **ST_IsRing(VARCHAR(ANY) Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object, which must be a
      line. Type: VARCHAR(ANY)
  - Returns
    BOOL Returns TRUE if the line is a ring; otherwise FALSE.

Details

A line is a ring if it is closed and simple.

Examples

```
SELECT inza..ST_IsRing(inza..ST_WKTToSQL('LINESTRING
(0 0, 11 0, 11 11, 0 0)'));

ST_IsSimple - Checks if the Geometry is Simple

Determines is a geometry is simple.

Usage

The ST_IsSimple function has the following syntax:

- **ST_IsSimple(VARCHAR(ANY) Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    BOOL Returns TRUE if the geometry is simple; otherwise FALSE.

Details

One example of not being simple is a geometry that intersects with itself.

Examples

```
SELECT inza..ST_IsSimple(inza..ST_WKTToSQL('POINT (1 1)'));

 ST_ISSIMPLE

ST_Length - Length of the Line

Determines the length of the linestring or multilinestring geometry.

Usage

The ST_Length function has the following syntax:

- **ST_Length(VARCHAR(ANY) Geometry); DOUBLE = ST_Length(VARCHAR(ANY) Geometry, VARCHAR(ANY) unit); DOUBLE = ST_Length(VARCHAR(ANY) Geometry, VARCHAR(ANY) unit, VARCHAR(ANY) cSystem);**
  - Parameters
    - **ST_GEOMETRY**
      A geometry object, which must be a LineString or
      MultiLineString. Type: VARCHAR(ANY)
    - **unit**
      The units. Possible values include "meter", "kilometer", "foot", "mile" and "nautical mile". Type: VARCHAR(ANY)
      Default: 'meter'
    - **cSystem**
      The coordinate system.
      Type: VARCHAR(ANY)
      Default: From geometry's SRID or 'WGS84' if geometry has no SRID.
  - Returns
    DOUBLE The length of the line.

Details

Function takes WKB (Well Known Binary) as an input. Geometric objects must be specified in terms of latitude/longitude on a spherical earth model.

Examples

```
SELECT inza..ST_Length(inza..ST_WKTToSQL('LINESTRING(0
0, 3 4, -1 1)'), 'meter', 'cartesian');

ST_LineFromMultiPoint - Make a Linstring from a Multipoint geometry

Makes a Linstring from a Multipoint geometry

Usage

The ST_LineFromMultiPoint function has the following syntax:

- **ST_LineFromMultiPoint(VARCHAR(ANY) ST_Geometry);**
  - Parameters
    - **ST_Geometry**
      A Multipoint geometry

      object. Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) A Linestring geometry object.

Details

ST_LineFromMultiPoint takes a Multipoint geometry object and returns a Linestring geometry object that connects all of the points.

Examples

```
SELECT
inza..ST_AsText(inza..ST_LineFromMultiPoint(inza..ST_WKTToSQL('M
ULTIPOINT (1 1, 1 2, 2 2, 2 1, 1 1)', 4326, false, true)));

ST_LocateAlong - Locate Along

Specifies a derived geometry collection value that matches the specified value of the m coordinate.

Usage

The ST_LocateAlong function has the following syntax:

- **ST_LocateAlong(VARCHAR(ANY) Geometry, DOUBLE m);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
    - **m**
      The start range of the measure to

      find. Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) Returns a derived geometry collection value that matches the specified value of m coordinate; returns an empty GeometryCollection for geometries without m values.

Details

Points, MultiPoints, LineStrings and MultiLineStrings are supported. This function operates only for cartesian coordinates.

Examples

```
SELECT
inza..ST_AsText(inza..ST_LocateAlong(inza..ST_WKTToSQL('M
ULTIPOINT (0 0 0 4, 100 0 0 5, 100 100 5 6, 0 100 7 8, 1 0

ST_LocateBetween - Locate Between

Determines a derived geometry collection value that matches the specified range of m coordinate values inclusively. Points, MultiPoints, LineStrings and MultiLineStrings are supported. This func-

tion operates only for cartesian coordinates.

Usage

The ST_LocateBetween function has the following syntax:

- **ST_LocateBetween(VARCHAR(ANY) Geometry, DOUBLE m1, DOUBLE m2);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
    - **m1**
      The start range of the measure to

      find. Type: VARCHAR(ANY)
    - **m2**
      The end range of the measure to

      find. Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) Returns a derived geometry collection value that matches the specified range of m coordinate values inclusively; returns an empty GeometryCollection for geometries without m val-ues.

Examples

```
SELECT
inza..ST_AsText(inza..ST_LocateBetween(inza..ST_WKTToSQL('MULTIP

ST_M - M Coordinate of a Point

Determines the m coordinate of a point object or sets the M coordinate of a point object to the specified M value.

Usage

The ST_M function has the following syntax:

- **ST_M(VARCHAR(ANY) Geometry); VARCHAR(100) = ST_M(VARCHAR(ANY) Geometry, DOUBLE M);**
  - Parameters
    - **ST_Geometry**
      A geometry object, which must be a point
      object. Type: VARCHAR(ANY)
    - **m**
      (Optional) The value to set for m. If NULL, the m value is removed from the
      point. Type: DOUBLE
  - Returns
    DOUBLE_Or_VARCHAR(100) The m coordinate or a geometry object with the m coordin-ate set to the value specified by m.

Examples

```
SELECT inza..ST_M(inza..ST_Point(0.0, 1.0, 2.0, 3.0));

ST_MaxY - Maximum Y Coordinate of a Geometry

Determines the maximum y coordinate of a geometry object.

Usage

The ST_MaxY function has the following syntax:

- **ST_MaxY(VARCHAR(ANY));**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    DOUBLE The maximum y coordinate; NULL if the geometry is empty.

Examples

```
SELECT inza..ST_MaxY(inza..ST_WKTToSQL('POLYGON ((10 10, 10 30,
20 20, 20 15, 10 10))'));

ST_MaxZ - Maximum Z Coordinate of a Geometry

Determines the maximum z coordinate of a geometry object.

Usage

The ST_MaxZ function has the following syntax:

- **ST_MaxZ(VARCHAR(ANY) Geometry);**
  - Parameters

- **ST_Geometry**
  A geometry object.

  Type: VARCHAR(ANY)

▲ Returns
DOUBLE The maximum z coordinate; NULL if the geometry is empty

Examples

```
SELECT inza..ST_MaxZ(inza..ST_WKTToSQL('POLYGON ((10 10 0, 10 20
1, 20 20 2, 20 15 3, 10 10 0))'));

ST_MBR - Bounding Box of a Geometry

Determines the bounding box of a geometry object.

Usage

The ST_MBR function has the following syntax:

- **ST_MBR(VARCHAR(ANY) Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(200) The bounding box as a geometry object.

Details

This function always returns a rectangle as a polygon. ST_MBR is exactly the same as ST_Envelope.

Examples

```
SELECT
inza..ST_AsText(inza..ST_MBR(inza..ST_WKTToSQL('POLYGO
N ((10 10, 10 20, 20 20, 20 15, 10 10))')));
ST_ASTEXT
-----------
 POLYGON ((10 10, 10 20, 20 20, 20 10, 10 10))
(1 row)

SELECT
inza..ST_AsText(inza..ST_MBR(inza..ST_WKTToSQL('POINT
(0 1)')));
ST_ASTEXT
-----------
 POLYGON ((0 1, 0 1, 0 1, 0 1, 0 1))
(1 row)
```

ST_MBRIntersects - Checks if MBRs of the Geometries Intersect

Determines whether the minimum bounding rectangles of the two geometries intersect.

Usage

The ST_MBRIntersects function has the following syntax:

- **ST_MBRIntersects(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    BOOL Returns TRUE if the minimum bounding rectangles of the two geometries intersect; other-wise FALSE.

Details

Returns TRUE if the DE-9IM intersection matrix for the minimum bounding rectangles of the two geometries is not FF*FF****.

Examples

```
SELECT inza..ST_MBRIntersects(inza..ST_WKTToSQL('POLYGON ((0 0,
11 0, 11 11, 0 11, 0 0))'), inza..ST_WKTToSQL('POLYGON ((10 10,

ST_MinM - Minimum M Coordinate of a Geometry

Determines the minimum m coordinate of a geometry object.

Usage

The ST_MinM function has the following syntax:

- **ST_MinM(VARCHAR(ANY) Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    DOUBLE The minimum m coordinate; NULL if the geometry is empty

Examples

```
SELECT inza..ST_MinM(inza..ST_WKTToSQL('POLYGON ((10 10 0
50, 10 20 1 60, 20 20 2 70, 20 15 3 80, 10 10 0 50))'));

ST_NumInteriorRing - Number of Interior Rings

Determines the number of interior rings of the polygon.

Usage

The ST_NumInteriorRing function has the following syntax:

- **ST_NumInteriorRing(VARCHAR(ANY) Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object, which must be a
      polygon. Type: VARCHAR(ANY)
  - Returns
    INT4 Number of interior rings of the polygon.

Examples

```
SELECT
inza..ST_NumInteriorRing(inza..ST_WKTToSQL('POLYGON  ((0
0, 100 0, 100 100, 0 100, 0 0), (10 10, 10 20, 20 20,

ST_NumPoints - Number of Vertices of the Geometry

Determines the number of vertices of the geometry object.

Usage

The ST_NumPoints function has the following syntax:

- **ST_NumPoints(VARCHAR(ANY) Geometry);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    INT4 The number of vertices of the geometry object.

Examples

```
SELECT inza..ST_NumPoints(inza..ST_WKTToSQL('POLYGON ((10 10, 10
20, 20 20, 20 15, 10 10))'));

ST_Overlaps - Checks if Geometries Overlap

Determines if two geometries overlap.

Usage

The ST_Overlaps function has the following syntax:

- **ST_Overlaps(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    BOOL Returns TRUE if the two geometries overlap; otherwise FALSE.

Details

Returns TRUE if the DE-9IM intersection matrix for the two geometries is T*T***T**, or, for two lines, 1*T***T**. Current implementation performs calculations treating all coordinate systems as cartesian.

Examples

```
SELECT inza..ST_Overlaps(inza..ST_WKTToSQL('LINESTRING
(0 0, 10 10)'), inza..ST_WKTToSQL('LINESTRING (5 5, 11

ST_Perimeter - Perimeter of Geometry

Computes the perimeter of the specified geometry.

Usage

The ST_Perimeter function has the following syntax:

- **ST_Perimeter(VARCHAR(ANY) Geometry); DOUBLE = ST_Perimeter(VARCHAR(ANY) Geometry, VARCHAR(ANY) unit); DOUBLE = ST_Perimeter(VARCHAR(ANY) Geometry, VARCHAR(ANY) unit, VARCHAR(ANY) cSystem);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
    - **unit**
      The units. Possible values include "meter", "kilometer", "foot", "mile" and "nautical mile". Type: VARCHAR(ANY)

      Default: 'meter'
    - **cSystem**
      The coordinate system.

      Type: VARCHAR(ANY)

      Default: The geometry's SRID or 'WGS84' if geometry has no SRID.
  - Returns
    DOUBLE The perimeter of the geometry object.

Examples

```
SELECT inza..ST_Perimeter(inza..ST_WKTToSQL('POLYGON((0 0, 0 1,
1 1, 1 0, 0 0))', 1234));
ST_PERIMETER

ST_Point - Point Constructor

Specifies a point geometry object with the specified coordinates.

Usage

The ST_Point function has the following syntax:

- **ST_Point(DOUBLE X, DOUBLE Y); VARCHAR(50) = ST_Point(DOUBLE X, DOUBLE Y, DOUBLE Z); VARCHAR(50) = ST_Point(DOUBLE X, DOUBLE Y, DOUBLE Z, DOUBLE M); VARCHAR(50) = ST_Point(DOUBLE X, DOUBLE Y, DOUBLE ZorM, BOOL isZ); VARCHAR(50) = ST_Point(DOUBLE X, DOUBLE Y, INT4 SRID); VARCHAR(50) = ST_Point(DOUBLE X, DOUBLE Y, DOUBLE Z, INT4 SRID); VARCHAR(50) = ST_Point(DOUBLE X, DOUBLE Y, DOUBLE Z, DOUBLE M, INT4 SRID); VARCHAR(50) = ST_Point(DOUBLE X, DOUBLE Y, DOUBLE ZorM, BOOL isZ, INT4 SRID);**
  - Parameters
    - **x**
      The x coordinate.

      Type: DOUBLE
    - **y**
      The y coordinate.

      Type: DOUBLE
    - **z**
      (Optional) The z

      coordinate. Type: DOUBLE
    - **m**
      (Optional) The m coordinate.

Type: DOUBLE

- **isZ**
  (Optional) TRUE indicates that the third parameter is z; false indicates
  m. Type: BOOL
- **SRID**
  (Optional) The Spatial reference system
  identifier. Type: INT4

▲ Returns
VARCHAR(50) A point geometry object.

Examples

```
SELECT inza..ST_AsText(inza..ST_Point(1.0, 5.0));
ST_ASTEXT
-----------
 POINT (1 5)
(1 row)

SELECT inza..ST_AsText(inza..ST_Point(1.0, 5.0, 6.0));

- **ST_PointN(VARCHAR(ANY), INT4);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
    - **n**
      A 1-based index.

      Type: INT4
  - Returns
    VARCHAR(100) A point object.

Examples

```
SELECT
inza..ST_AsText(inza..ST_POINTN(inza..ST_WKTToSQL('LINEST
RING (0 0, 1 1, 2 2, 10 10)'), 2));

ST_Relate - Relation of Geometries

Determines whether the intersection matrix of two geometries equals the specified intersection matrix.

Usage

The ST_Relate function has the following syntax:

- **ST_Relate(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2, CHAR(9) intersectionMatrix);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
    - **intersectionMatrix**
      Dimensionally Extended 9 Intersection Model (DE-

      9IM). Type: CHAR(9)
  - Returns
    BOOL Returns TRUE if the intersection matrix of two geometries equals the specified intersection matrix; otherwise FALSE.

Examples

```
SELECT inza..ST_RELATE(inza..ST_WKTToSQL('LINESTRING
(0 0, 10 10)'), inza..ST_WKTToSQL('LINESTRING (5 5, 11

ST_SRID - Setter/Getter of the SRID

Sets or gets the SRID from a geometry object.

Usage

The ST_SRID function has the following syntax:

- **ST_SRID(VARCHAR(ANY) Geometry); VARCHAR(30) = ST_SRID(VARCHAR(ANY) Geometry, INT4 SRID);**
  - Parameters

- **ST_Geometry**
  A geometry object.

  Type: VARCHAR(ANY)

- **SRID**
  (Optional) If specified, sets the Spatial Reference System

  Identifier. Type: INT4

▲ Returns
INT4_Or_VARCHAR(200) The SRID for the get. A geometry with the SRID for the set.

Examples

```
SELECT inza..ST_SRID(inza..ST_Point(1.0, 5.0, 4326));

 ST_SRID
---------
    4326
(1 row)

SELECT inza..ST_SRID(inza..ST_WKTToSQL('POLYGON((10 10, 10

ST_SymDifference - Symmetric Difference of Geometries

Determines a geometry object representing the non-intersecting parts of the specified geometries.

Usage

The ST_SymDifference function has the following syntax:

- **ST_SymDifference(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) A geometry object representing the non-intersecting parts of the specified geomet-ries.

Examples

```
SELECT
inza..ST_ASTEXT(inza..ST_SYMDIFFERENCE(inza..ST_WKTToSQL('POLYGO
N ((0 0, 11 0, 11 11, 0 11, 0 0))'), inza..ST_WKTToSQL('POLYGON
((10 10, 10 20, 20 20, 20 15, 10 10))')));
ST_ASTEXT
-----------
 MULTIPOLYGON (((11 10.5, 11 0, 0 0, 0 11, 10 11, 10 10, 11
10.5)), ((11 10.5, 11 11, 10 11, 10 20, 20 20, 20 15, 11
10.5)))
(1 row)
```

ST_Touches - Checks if Geometries Touch

Determines whether the two geometries touch, but their interiors do not intersect.

Usage

The ST_Touches function has the following syntax:

- **ST_Touches(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    BOOL TRUE if the two geometries touch, but their interiors do not intersect; otherwise FALSE.

Details

Returns TRUE if the DE-9IM intersection matrix for the two geometries is FT*******, F**T***** or F***T****. The current implementation performs calculations treating all coordinate systems as cartesian.

Examples

```
SELECT inza..ST_Touches(inza..ST_WKTToSQL('LINESTRING
(0 0, 10 10)'), inza..ST_WKTToSQL('LINESTRING (5 5, 11
11)'));

ST_Union - Create a geometry that is the union of a table of geometries.

Creates a geometry by doing a union on a table of geometries

Usage

The ST_Union aggregate has the following syntax:

- **ST_Union(VARCHAR(ANY) geometry);**
  - Parameters
    - **geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) The unified geometry object.

Examples

```
CREATE TABLE points (PointID integer, the_geom VARCHAR(200));
INSERT INTO points VALUES (1, inza..ST_WKTToSQL('Point (0 0)'));
INSERT INTO points VALUES (2, inza..ST_WKTToSQL('Point (22
0)'));
INSERT INTO points VALUES (3, inza..ST_WKTToSQL('Point (33
33)'));
INSERT INTO points VALUES (4, inza..ST_WKTToSQL('Point (44
44)'));
SELECT inza..ST_AsText(inza..ST_Union(the_geom)) from (SELECT
the_geom from points order by PointID LIMIT 9999999) points;
DROP TABLE points;
                ST_ASTEXT

ST_Union - Union of Geometries

Finds a geometry object representing the union of the specified geometries.

Usage

The ST_Union function has the following syntax:

- **ST_Union(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) A geometry object representing the union of the specified geometries.

Examples

```
SELECT
inza..ST_AsText(inza..ST_Union(inza..ST_WKTToSQL('POLYGON
((0 0, 5 0, 5 5, 0 5, 0 0))'), inza..ST_WKTToSQL('POLYGON
((10 10, 10 20, 20 20, 20 15, 10 10))')));
ST_ASTEXT
-----------
 MULTIPOLYGON (((0 0, 5 0, 5 5, 0 5, 0 0)), ((10 10,
10 20, 20 20, 20 15, 10 10)))
(1 row)
```

ST_Version - IBM Netezza Spatial Version

Returns the version of the IBM Netezza Spatial Package.

Usage

The ST_Version function has the following syntax:

- **ST_Version();**
  - Returns
    VARCHAR(20) The version of IBM Netezza Spatial Package.

Related Functions

- category Spatial

ST_Within - Checks if the Geometry is Within Another Geometry

Determines if the first specified geometry is completely within the second geometry.

Usage

The ST_Within function has the following syntax:

- **ST_Within(VARCHAR(ANY) Geometry1, VARCHAR(ANY) Geometry2, VARCHAR(ANY) cSystem);**
  - Parameters
    - **ST_Geometry1**
      A geometry object.

      Type: VARCHAR(ANY)
    - **ST_Geometry2**
      A geometry object.

      Type: VARCHAR(ANY)
    - **cSystem**
      The coordinate system.

      Type: VARCHAR(ANY)

      Default: From geometry's SRID or 'WGS84' if geometry has no SRID.
  - Returns
    BOOL Returns TRUE if the first geometry is completely within the second geometry; otherwise FALSE.

Details

Returns TRUE if the DE-9IM intersection matrix for the two geometries is T*F**F***. ST_Within is the re-verse of ST_Contains. The current implementation performs calculations treating all coordinate systems as cartesian.

Examples

```
SELECT inza..ST_Within(inza..ST_WKTToSQL('POLYGON ((10 10, 10
20, 20 20, 20 15, 10 10))', 1234), inza..ST_WKTToSQL('POLYGON
((0 0, 110 0, 110 110, 0 110, 0 0))', 1234));
```

```

ST_WKBToSQL - Geometry from WKB Representation

Determines a geometry object from the Well-Known Binary (WKB) representation.

Usage

The ST_WKBToSQL function has the following syntax:

- **ST_WKBToSQL(VARCHAR(ANY) WKB); VARCHAR(ANY) = ST_WKBToSQL(VARCHAR(ANY) WKB, INT4 Srid); VARCHAR(ANY) = ST_WKBToSQL(VARCHAR(ANY) WKB, INT4 Srid, BOOL ComputeMBR); VARCHAR(ANY) = ST_WKBToSQL(VARCHAR(ANY) WKB, INT4 Srid, BOOL ComputeMBR, BOOL SkipSimpleTest);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
    - **SRID**
      The Spatial Reference System

      Identifier. Type: INT4

      Default: 4326
    - **computeMBRFlag**
      A Boolean value indicating whether the MBR should be

      computed. Type: BOOL

      Default: TRUE
    - **skipSimpleTest**
      (Optional) A Boolean value indicating whether the simple geometry test should be skipped.

      Type: BOOL

Default: FALSE

- Returns
  VARCHAR(ANY) A geometry object.

Details

ST_WKBToSQL is exactly the same as ST_GeomFromWKB. ST_WKBToSQL is the reverse of ST_AsBinary.

Examples

```
select
inza..ST_AsText(inza..ST_WKBToSQL(inza..ST_AsBinary(inza..ST_WKT
ToSQL('POLYGON ((0 0, 11 0, 11 11, 0 11, 0 0))'))));

ST_WKBToWKT - WKT Representation from WKB Format

Returns the Well-Known Text (WKT) representation of a geometry object.

Usage

The ST_WKBToWKT function has the following syntax:

- **ST_WKBToWKT(VARCHAR(ANY) WKB);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
  - Returns
    VARCHAR(ANY) The Well-Known Text (WKT) representation of a geometry object.

Details

Does not return the SRID. ST_WKBToWKT is the reverse of ST_GeomFromText.

Examples

```
SELECT inza..ST_WKBToWKT(inza..ST_WKTToWKB('POLYGON((0
0, 1 2, 3 -1, 0 0))'));
ST_WKBTOWKT
-------------

ST_WKTToSQL - Geometry from WKT Representation

Determines a geometry object from the Well-Known Text (WKT) representation.

Usage

The ST_WKTToSQL function has the following syntax:

- **ST_WKTToSQL(VARCHAR(ANY) WKTString); VARCHAR(ANY) = ST_WKTToSQL(VARCHAR(ANY) WKT-STring,INT4 Srid); VARCHAR(ANY) = ST_WKTToSQL(VARCHAR(ANY) WKTString,INT4 Srid, BOOL Com-puteMBR); VARCHAR(ANY) = ST_WKTToSQL(VARCHAR(ANY) WKTString,INT4 Srid, BOOL Com-puteMBR, BOOL SkipSimpleTest);**
  - Parameters
    - **ST_Geometry**
      A geometry object.

      Type: VARCHAR(ANY)
    - **SRID**
      The Spatial Reference System

      Identifier. Type: INT4

      Default: 4326
    - **computeMBRFlag**
      (Optional) A Boolean value indicating whether the MBR should be

      computed. Type: BOOL

      Default: TRUE
    - **skipSimpleTest**
      (Optional) A Boolean value indicating whether the simple geometry test should be

      skipped. Type: BOOL

      Default: FALSE
  - Returns

VARCHAR(ANY) A geometry object.

Details

ST_WKTToSQL is exactly the same as ST_GeomFromWKT. ST_WKTToSQL is the reverse of ST_As-Text.

Examples

```
SELECT inza..ST_AsText(inza..ST_WKTToSQL('POLYGON

ST_X - X Coordinate of a Point

Determines the x coordinate of a point object, or sets the x coordinate of a point object, to the specified value.

Usage

The ST_X function has the following syntax:

- **ST_X(VARCHAR(ANY) Geometry); VARCHAR(100) = ST_X(VARCHAR(ANY) Geometry, DOUBLE X);**
  - Parameters
    - **ST_Geometry**
      A geometry object, which must be a point
      object. Type: VARCHAR(ANY)
    - **x**
      (Optional) Sets the value for the x
      coordinate. Type: DOUBLE
  - Returns
    DOUBLE_Or_VARCHAR(100) The x coordinate, or a geometry object with the x coordinate set to the specified x value.

Examples

```
SELECT inza..ST_X(inza..ST_Point(0.0, 1.0));
 ST_X
------
    0
(1 row)

SELECT inza..ST_AsText(inza..ST_X(inza..ST_Point(0.0,

ST_Y - Y Coordinate of a Point

Determines the y coordinate of a point object, or sets the y coordinate of a point object, to the specified value.

Usage

The ST_Y function has the following syntax:

- **ST_Y(VARCHAR(ANY) Geometry); VARCHAR(100) = ST_Y(VARCHAR(ANY) Geometry, DOUBLE Y);**
  - Parameters
    - **ST_Geometry**
      A geometry object, which must be a point

      object. Type: VARCHAR(ANY)
    - **y**
      (Optional) Sets the value for the y

      coordinate. Type: DOUBLE
  - Returns
    DOUBLE_Or_VARCHAR(100) The y coordinate, or a geometry object with the y coordinate set to the value specified by y.

Examples

```
SELECT inza..ST_Y(inza..ST_Point(0.0,
1.0)); ST_Y
------
    1
(1 row)

SELECT inza..ST_AsText(inza..ST_Y(inza..ST_Point(0.0,

ST_Z - Z Coordinate of a Point

Determines the z coordinate of a point object or sets the z coordinate of a point object to the spe-cified value.

Usage

The ST_Z function has the following syntax:

- **ST_Z(VARCHAR(ANY) Geometry); VARCHAR(100) = ST_Z(VARCHAR(ANY) Geometry, DOUBLE Z);**
  - Parameters
    - **ST_Geometry**
      A geometry object, which must be a point
      object. Type: VARCHAR(ANY)
    - **z**
      (Optional) Sets the value for the z coordinate. If NULL, the z value is removed from the
      point. Type: DOUBLE
  - Returns
    DOUBLE_Or_VARCHAR(100) The z coordinate or the geometry object with the z coordinate set to the specified z value.

Examples

```
SELECT inza..ST_Z(inza..ST_Point(0.0, 1.0, 2.0));
 ST_Z
------
    2

CHAPTER 3
Reference Documentation: Utilities

ST_CreateGeomColumn - Create the Geometry Column Table

This stored procedure creates the Geometry Column Table if it does not exists. It will preserve the table if it already exists.

Usage

The ST_CreateGeomColumn stored procedure has the following syntax:

- **ST_CreateGeomColumn()**
  - Returns
    BOOLEAN true on success and false on failure.

Examples

```
\c inza
set PATH=inza.inza;
call inza..ST_CreateGeomColumn();
 ST_CREATEGEOMCOLUMN
-------------
 f
(1 row)
```

Related Functions

- category Utilities - Actions

ST_CreateSpatialRefSys - Create the Spatial Reference System Table

This stored procedure creates the Spatial Reference System Table if it does not exists. It will pre-serve the table if it already exists.

Usage

The ST_CreateSpatialRefSys stored procedure has the following syntax:

- **ST_CreateSpatialRefSys()**
  - Returns
    BOOLEAN true on success and false on failure.

Examples

```
\c inza

set PATH=inza.inza;

call inza..ST_CreateSpatialRefSys();

 ST_CREATESPATIALREFSYS
------------
 f
(1 row)
```

Related Functions

- category Utilities - Actions

ST_MapPolygonsToGrid - Maps polygons to a grid

This stored procedure maps a table of geometries to grid cells.

Usage

The ST_MapPolygonsToGrid stored procedure has the following syntax:

- **ST_MapPolygonsToGrid(DOUBLE PRECISION GRIDSIZE, CHARACTER VARYING(ANY) SHAPETABLE, CHARACTER VARYING(ANY) SHAPECOLUMN, BOOLEAN DBG, INTEGER SHAPESRID, CHARACTER VARYING(ANY) SHAPEIDCOLUMN, BOOLEAN INCLUDE_ALL_COLUMNS)**

- Parameters
  - **GRIDSIZE**
    The Grid size in degrees. Allowable values are 1, .1 and .01. Type: DOUBLE PRECISION
  - **SHAPETABLE**
    The table containing the polygons to map. Type: CHARACTER VARYING(ANY)
  - **SHAPECOLUMN**
    Geometry column name for input table.
    Type: CHARACTER VARYING(ANY)
  - **DBG**
    Enable/Disable debug messages. This will leave all intermediate tables if you want to debug. Type: BOOLEAN
  - **SHAPESRID**
    The SRID used when calling ST_SpatialGridIndex. Type: INTEGER
  - **SHAPEIDCOLUMN**
    Identifier column for input data..
    Type: CHARACTER VARYING(ANY)
  - **INCLUDE_ALL_COLUMNS**
    This parameter optionally allows users to include all columns in the input table. If FALSE, it will create an output table with the following columns only ID_COLUMN, GEOM_COLUMN, GRID_ID, GRID_GEOMETRY.
    Type: BOOLEAN
- Returns
  INTEGER 0 if success and 1 if error.

Details

This stored procedure maps the passed in table's geometries to the specified grid cell using the grid table specified (1, 0.1, 0.01). If the grid table doesn't already exist, it will be created. The output is a new table with one row for each input geometry/grid cell intersection.

Examples

```
set PATH=inza.inza;
create table POINTS (ID INTEGER, MY_GEOM VARCHAR(64000));
insert into POINTS VALUES (1, inza..ST_WKTToSQL('Point (1.1
1.1)'));
insert into POINTS VALUES (2, inza..ST_WKTToSQL('Point (2.2
2.2)'));
insert into POINTS VALUES (3, inza..ST_WKTToSQL('Point (3.3
```

```
3.3)'));

alter table points owner to inzauser;

CALL
inza..ST_MAPPOLYGONSTOGRID(1,'POINTS','MY_GEOM',false,432
6,'ID',true);

select ID, inza..ST_ASTEXT(MY_GEOM), ONEGID,
inza..ST_ASTEXT(ONEGRID_GEOM) from

POINTS_ONE_GRIDMAP; drop table POINTS_ONE_GRIDMAP;

drop table POINTS;

drop table GRID_ONE_GEOMETRIES;

delete from GEOMETRY_COLUMNS where
F_TABLE_NAME='POINTS_ONE_GRIDMAP';

 ST_MAPPOLYGONSTOGRID
----------------------
                     0
(1 row)

 ID |    ST_ASTEXT    | ONEGID |               ST_ASTEXT
----+-----------------+--------
+-------------------------------------
  2 | POINT (2.2 2.2) |  92182 | POLYGON ((2 2, 2 3, 3 3,
32,22))
  3 | POINT (3.3 3.3) |  93183 | POLYGON ((3 3, 3 4, 4 4,
43,33))
  1 | POINT (1.1 1.1) |  91181 | POLYGON ((1 1, 1 2, 2 2,
21,11))

ST_SpatialGridIndex - Creates a spatial grid index

This stored procedure creates a grid table.

Usage

The ST_SpatialGridIndex stored procedure has the following syntax:

- **ST_SpatialGridIndex(DOUBLE PRECISION GRIDSIZE, BOOLEAN DBG, INTEGER SRID)**
  - Parameters
    - **GRIDSIZE**
      The Grid size in degrees. Allowable values are 1, .1 and .01. Type: DOUBLE PRECISION
    - **DBG**
      Enable/Disable debug messages. This will leave all intermediate tables if you want to debug. Type: BOOLEAN
    - **SRID**
      The SRID used to initialize the grid. Type: INTEGER
  - Returns
    INTEGER 0 if success and 1 if error.

Details

This stored procedure creates a grid table of either 1, .1 or .01 degrees.

Examples

```
set PATH=inza.inza;
call inza..ST_SPATIALGRIDINDEX(1,'FALSE',4326);
select count(*) from grid_one_geometries; drop
table grid_one_geometries;
call inza..ST_SPATIALGRIDINDEX(0.1,'FALSE',4326);
select count(*) from grid_point1_geometries; drop
table grid_point1_geometries;

The following paragraph does not apply to the United Kingdom or any other country where such pro-visions are inconsistent with local law: INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IM-PLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MER-CHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of ex-press or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publica-tion. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:
IBM Corporation
26 Forest Street
Marlborough, MA 01752 U.S.A.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement

or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been es-timated through extrapolation. Actual results may vary. Users of this document should verify the ap-plicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

All statements regarding IBM's future direction or intent are subject to change or withdrawal without notice, and represent goals and objectives only. This information is for planning purposes only. The in-formation herein is subject to change before the products described become available.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.

COPYRIGHT LICENSE:

This information contains sample application programs in source language, which illustrate program-ming techniques on various operating platforms. You may copy, modify, and distribute these sample programs in any form without payment to IBM, for the purposes of developing, using, marketing or distributing application programs conforming to the application programming interface for the operat-ing platform for which the sample programs are written. These examples have not been thoroughly tested under all conditions. IBM, therefore, cannot guarantee or imply reliability, serviceability, or function of these programs. The sample programs are provided "AS IS", without warranty of any kind. IBM shall not be liable for any damages arising out of your use of the sample programs.

Each copy or any portion of these sample programs or any derivative work, must include a copyright notice as follows:

© (your company name) (year). Portions of this code are derived from IBM Corp. Sample Programs. © Copyright IBM Corp. (enter the year or years). All rights reserved.

Trademarks

IBM, the IBM logo, ibm.com and Netezza are trademarks or registered trademarks of International Business Machines Corporation in the United States, other countries, or both. If these and other IBM trademarked terms are marked on their first occurrence in this information with a trademark symbol (® or ™),these symbols indicate U.S. registered or common law trademarks owned by IBM at the time this information was published. Such trademarks may also be registered or common law trademarks in other countries. A current list of IBM trademarks is available on the Web at "Copyright and trade-mark information" at ibm.com/legal/copytrade.shtml.

The following terms are trademarks or registered trademarks of other companies:

Adobe is a registered trademark of Adobe Systems Incorporated in the United States, and/or other countries.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

NEC is a registered trademark of NEC Corporation.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Java and all Java-based trademarks are trademarks of Sun Microsystems, Inc. in the United States, other countries, or both.

Red Hat is a trademark or registered trademark of Red Hat, Inc. in the United States and/or other countries.

D-CC, D-C++, Diab+, FastJ, pSOS+, SingleStep, Tornado, VxWorks, Wind River, and the Wind River logo are trademarks, registered trademarks, or service marks of Wind River Systems, Inc. Tornado patent pending.

APC and the APC logo are trademarks or registered trademarks of American Power Conversion Corporation.

Other company, product or service names may be trademarks or service marks of others.

Regulatory and Compliance

Regulatory Notices

Install the NPS system in a restricted-access location. Ensure that only those trained to operate or service the equipment have physical access to it. Install each AC power outlet near the NPS rack that plugs into it, and keep it freely accessible. Provide approved 30A circuit breakers on all power sources.

Product may be powered by redundant power sources. Disconnect ALL power sources before servi-cing. High leakage current. Earth connection essential before connecting supply. Courant de fuite élevé. Raccordement à la terre indispensable avant le raccordement au réseau.

Homologation Statement

This product may not be certified in your country for connection by any means whatsoever to interfaces of public telecommunications networks. Further certification may be required by law prior to making any such connection. Contact an IBM representative or reseller for any questions.

FCC - Industry Canada Statement

This equipment has been tested and found to comply with the limits for a Class A digital device, pursu-ant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

This Class A digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numérique de la classe A respecte toutes les exigences du Règlement sur le matériel brouilleur du Canada.

CE Statement (Europe)

This product complies with the European Low Voltage Directive 73/23/EEC and EMC Directive 89/336/EEC as amended by European Directive 93/68/EEC.

Warning: This is a class A product. In a domestic environment this product may cause radio interfer-ence in which case the user may be required to take adequate measures.

VCCI Statement

この装置は、情報処理装置等電波障害自主規制協議会 (VCCI) の基準に基づくクラスＡ 情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起越すことがあります。この場合には使用者が適切な対策を講ずるう要求されることがあります。
